

ROUTING PROTOCOLS

The background of the slide features a stylized world map in shades of blue. The map is composed of a grid of small dots, with several larger, brighter dots acting as nodes. These nodes are interconnected by thin, glowing blue lines that represent network routes. The map is set against a dark blue background filled with a pattern of binary code (0s and 1s) in a lighter blue color. The overall aesthetic is high-tech and digital.

This set of transparencies, hereinafter referred to as slides, is protected by copyright laws and provisions of International Treaties. The title and copyright regarding the slides (including, but not limited to, each and every image, photography, animation, video, audio, music and text) are property of the authors specified on page 1.

The slides may be reproduced and used freely by research institutes, schools and Universities for non-profit, institutional purposes. In such cases, no authorization is requested.

Any total or partial use or reproduction (including, but not limited to, reproduction on magnetic media, computer networks, and printed reproduction) is forbidden, unless explicitly authorized by the authors by means of written license.

Information included in these slides is deemed as accurate at the date of publication. Such information is supplied for merely educational purposes and may not be used in designing systems, products, networks, etc. In any case, these slides are subject to changes without any previous notice. The authors do not assume any responsibility for the contents of these slides (including, but not limited to, accuracy, completeness, enforceability, updated-ness of information hereinafter provided).

In any case, accordance with information hereinafter included must not be declared.

In any case, this copyright notice must never be removed and must be reported even in partial uses.

TWO PROTOCOL FAMILIES

Two Kinds of Protocols

- Interior Gateway Protocol (IGP)
 - Intra-domain routing
- Exterior Gateway Protocol (EGP)
 - Inter-domain routing

域间路由

面向不同的对象，有不同的设计准则

Different objectives

Different design criteria

IGP Features

分发拓扑信息

- Distribute topological information
- Choose routes based on topological information
 - Find “best” route

根据拓扑信息选择最佳路由

EGP Features

→ Distribute Autonomous System information

分发自治系统信息

→ Distribute administrative costs

分发管理开销

→ Decide based on policies

→ Find “preferred” route

基于策略选择喜好路由

IGP – Distance Vector

路由信息协议

→ RIP: Routing Information Protocol

→ IGRP: Interior Gateway Routing Protocol

内部网关路由协议

→ E-IGRP: Enhanced IGRP

增强内部网关内部路由协议

IGP – Link State

开放最短路径优先

- OSPF: Open Shortest Path First
- Integrated IS-IS

被整合到了IS-IS协议中了

EGP

边界网关协议

→ BGP: Border Gateway Protocol

→ IDRP: Inter Domain
Routing Protocol

国际域名路由协议

→ Static routing also a viable option

静态路由也是一个可行的选择

INTERIOR GATEWAY PROTOCOLS

RIP

- Originally developed for another architecture
- RFC 1058 (1988) and RFC 1388 (1993)
- Implemented also by Unix/Linux hosts

Features

- Hop count 跳数统计
- At most 15 hops 最多15跳
- Periodic update messages 周期性的更新信息
- Distance vectors DV
- Every 30 s
- Time-out based operation
- Convergence: 3 min 收敛：3Min

IGRP

思科专有

- Cisco Systems proprietary
- It overcomes some of the shortcomings of RIP
- For a while, the only alternative to RIP

克服了RIP的部分缺点

有时候，对于RIP是唯一的替代选项

Features

→ Articulated metrics

→ Delay

延时

→ Bandwidth

带宽

→ Reliability

可靠性

→ Load

负载

→ Maximum packet length

→ Multipath routing

多路径路由

OSPF

→ RFC 1247 (1991) and RFC 1583 (1994)

→ Hierarchical routing

等级路由

→ Routing domain divided in areas

按区域划分路由域

→ Aggregation of information among areas

Hierarchical Routing

路由器知道其他域的所有信息

- Routers know all details of their domain/zone/area
- Routers have limited or no knowledge about the outside
- Can be iterated

路由器知道很少外面的信息

Strictly Hierarchical Routing

No knowledge/visibility outside own area/domain/zone

完全不知道外面的信息

→ When the destination of a packet is not in the area, it is forwarded towards an edge router

当一个包的目标地址不属于内部，它会被转发到边界路由

→ Maximum scale

最大饱和

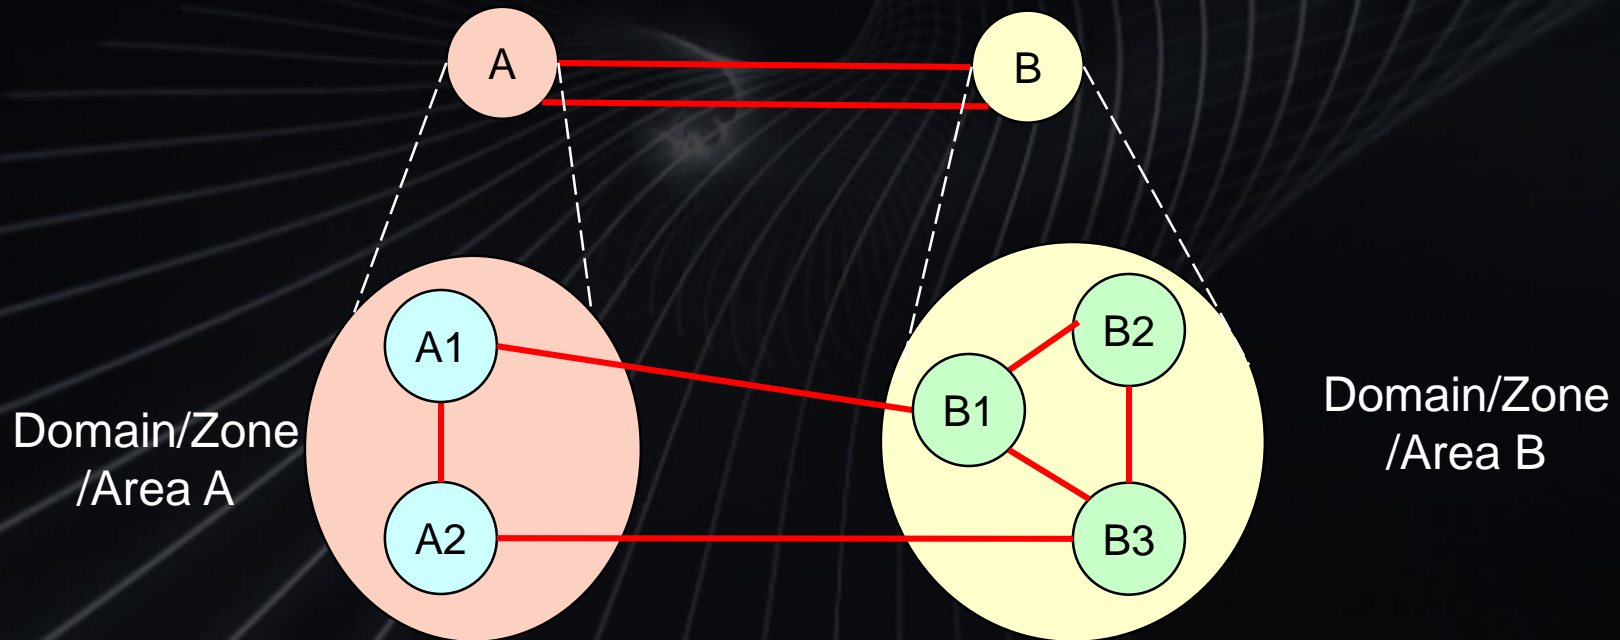

→ Limited routing capability

限制了路由功能

Strictly Hierarchical Routing

Higher layer routers have
area/domain/zone level view

Strictly Hierarchical Routing

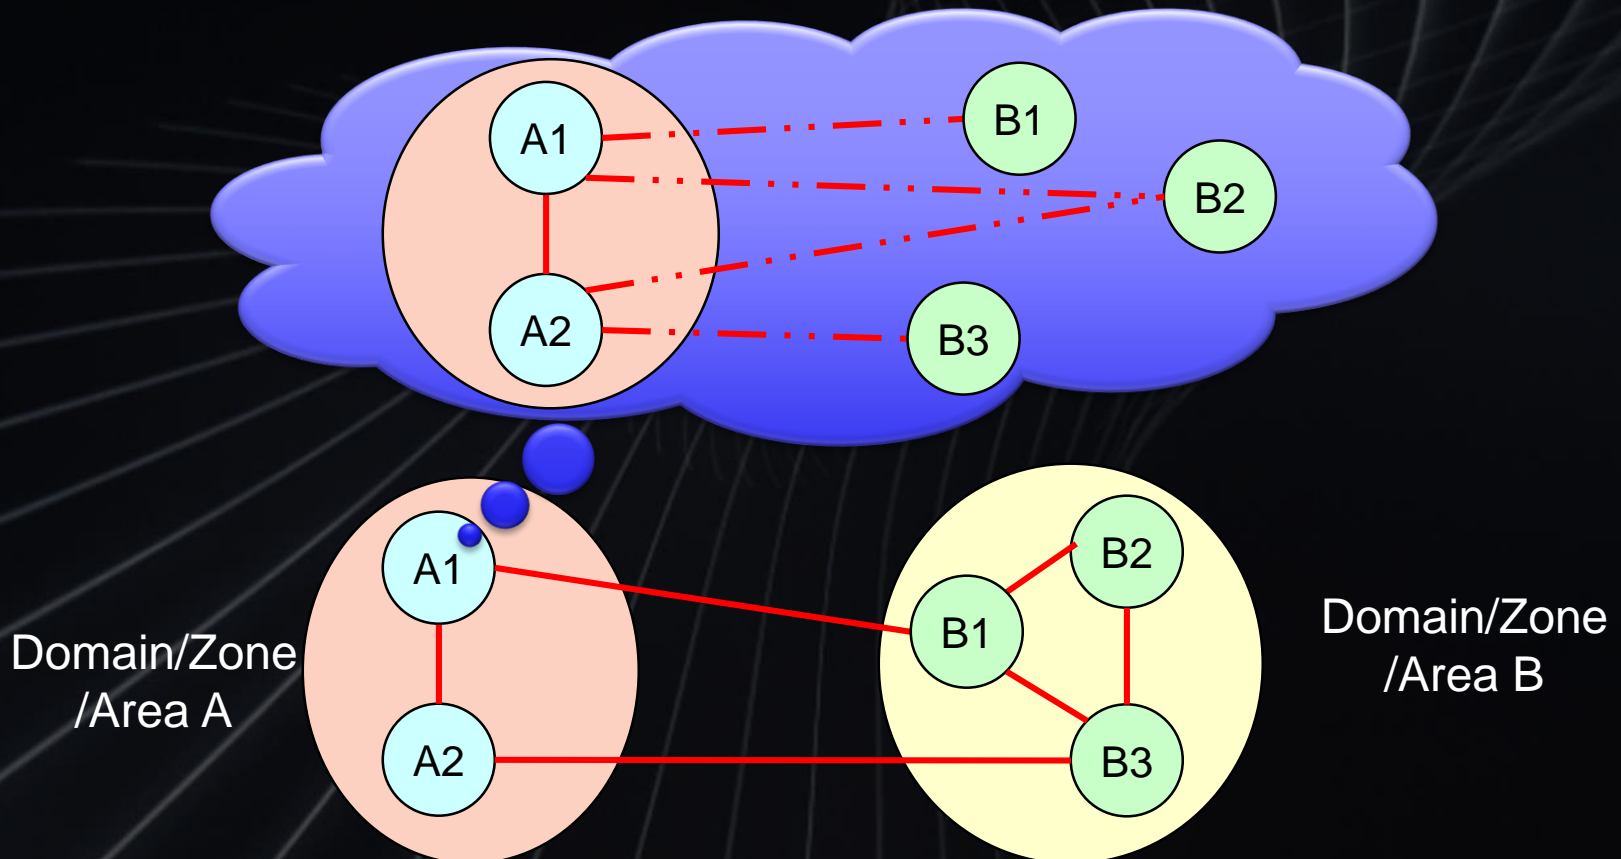

- Sub-optimal paths
- Loss of connectivity due to faults

Loosely Hierarchical Routing

Routers have high level knowledge of the outside

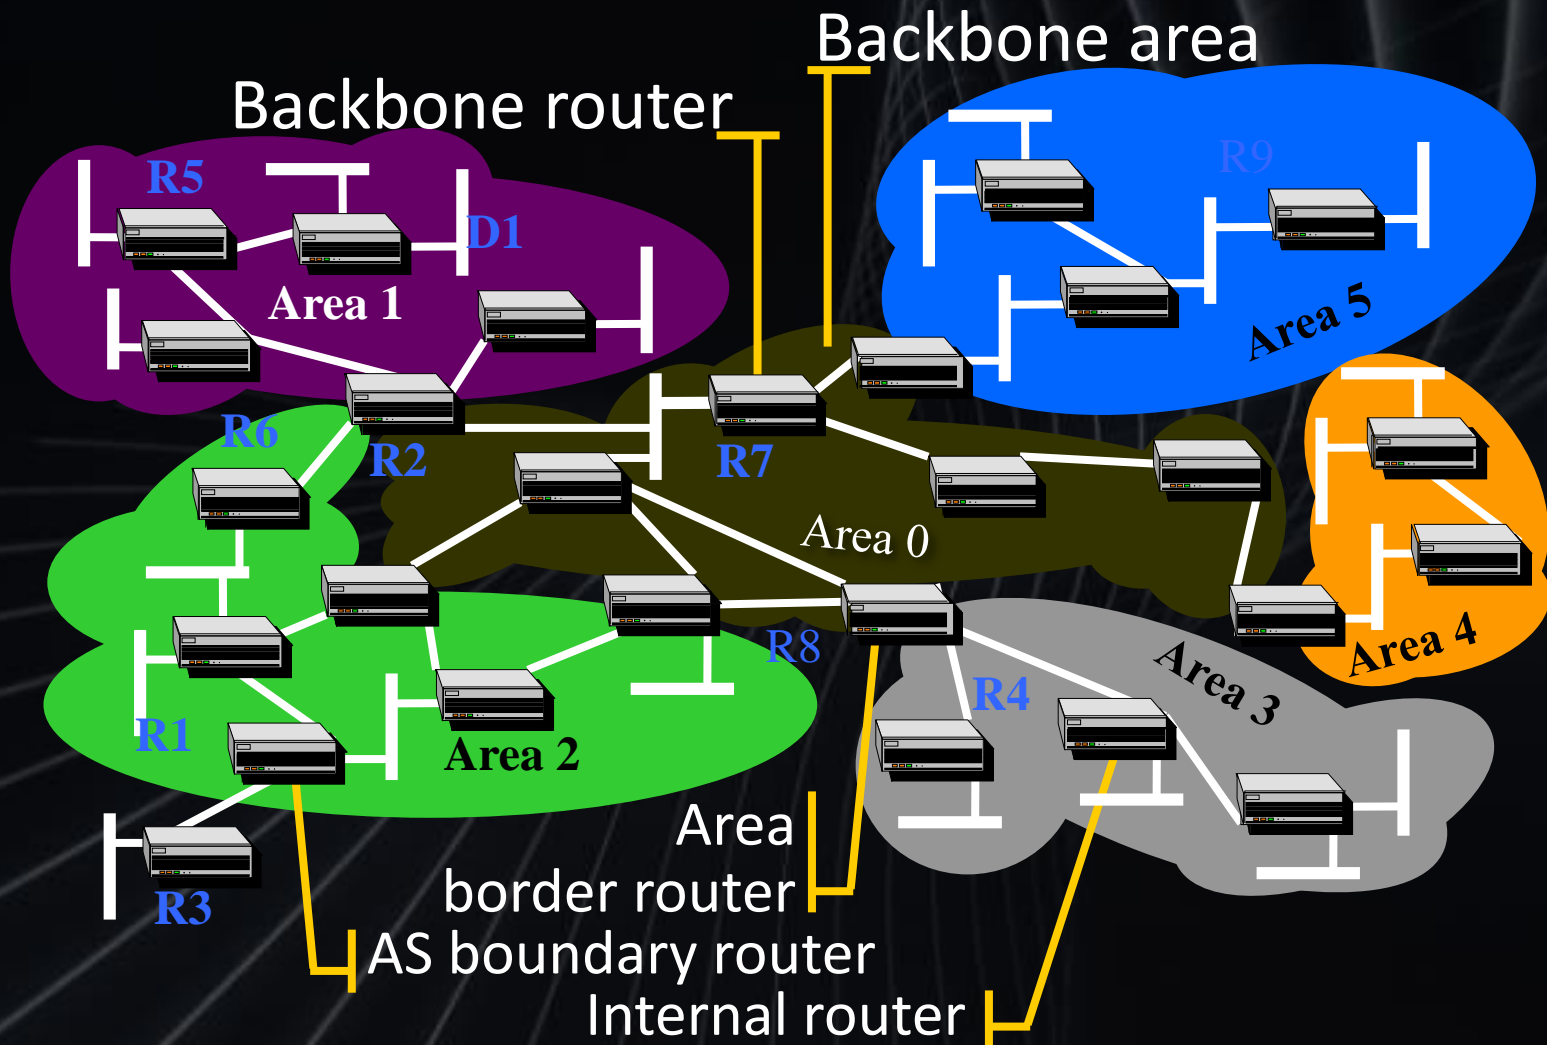

路由有更高等级的外部信息

Loosely Hierarchical Routing

- Less scalability 更低的扩展性
 - Routers have to store and exchange more information
- Does not require strictly hierarchical addressing 并不要求严格的等级寻址
 - All host in domain B do not need a common identifier 在域B中的所有主机并不需要通用标识符
 - Prefix 前缀
- Possible in IPv4

OSPF Architecture

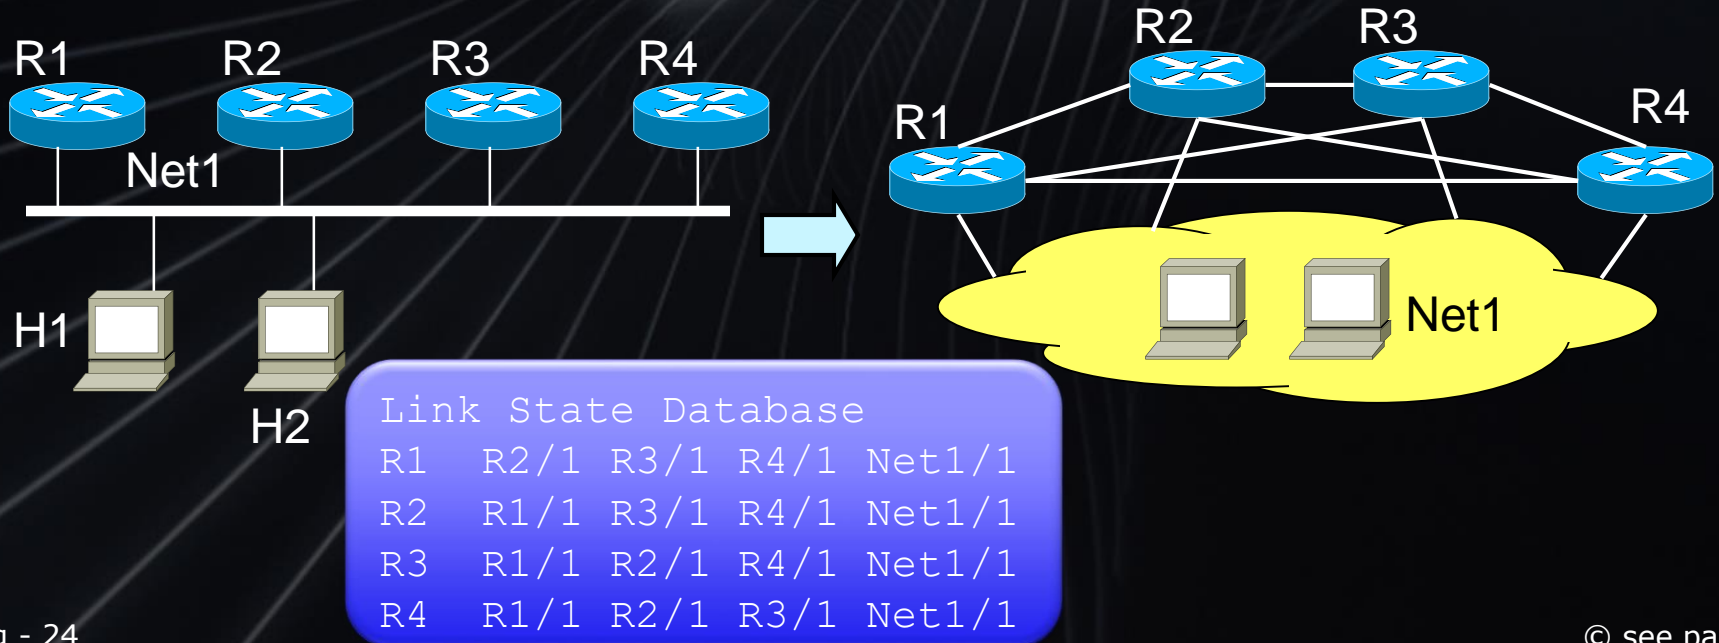

Broadcast Networks

→ N routers = N^2 adjacencies 邻接项

→ N^2 links

→ Dijkstra complexity is linear with number of links
Dijkstra的复杂度是随着链接数线性增长的

Broadcast Networks

→ Pseudo-node

→ Virtual node to transform full mesh into star

虚拟节点把网状结构转换成星状

→ Role played by one of the routers (election)

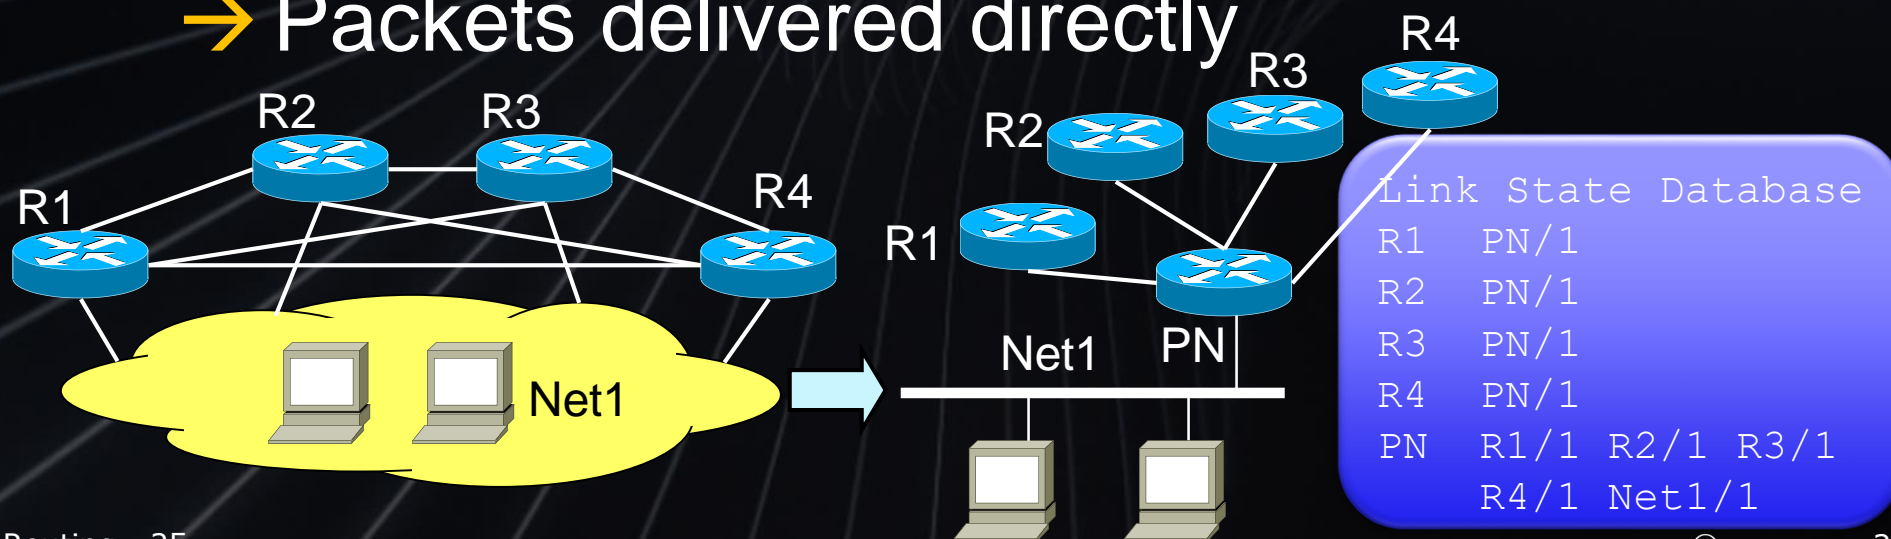

虚拟节点由其中的一个路由来扮演

→ Only for (proactive) routing

主要用于非自适应路由中的主动路由

→ Packets delivered directly

数据包直接派送

Integrated IS-IS

OSI协议的拓展

- Extension of an OSI protocol
- Hierarchical routing
- Different level routers

等级路由

不同等级的路由

→ Widely deployed before OSPF was available

在OSPF可用前广泛部署

→ Large networks

大型网络

→ ISPs

→ Still in use

→ Do not change what works

EXTERIOR GATEWAY PROTOCOLS

外部网关协议

BGP

- Currently Version 4
 - RFC 1654 (1994)
- Path vector
 - AS sequence to destination
- Rich set of attributes
- Configurable route computation policy

可配置路由计算策略

InterDomain Routing Protocol (IDRP)

域间路由协议

- Evolution of BGP for OSI BGP针对于OSI的进化版
- Ported back to TCP/IP 移植回TCP/IP
- Supposed to be “the” choice for IPv6 应该是IPv6的选择
- Not used a lot 使用并不广泛
